P2P Process Analysis
SLA, Bottlenecks & Risk

Executive Summary - P2P Process Delay Analysis

Key Findings

- SLA performance on closed cases remains relatively stable; however, the share of open cases increased materially in recent periods, indicating growing execution backlog.
- The main structural bottleneck is the **Invoice Receipt → Clear Invoice** stage, which contributes the largest share of total lead time in delayed cases.
- Delay risk is concentrated across selected segments: top vendors and top spend areas account for the majority of delayed cases.
- One company entity represents nearly all delayed volume, suggesting local process or governance issues.

KPI Snapshot

- Analysed cases: 139,549
- Delay threshold: >75 days
- Main bottleneck: IR → CI
- Top 15 vendors: 52% of delayed cases
- Top 10 spend areas: 82% of delayed cases

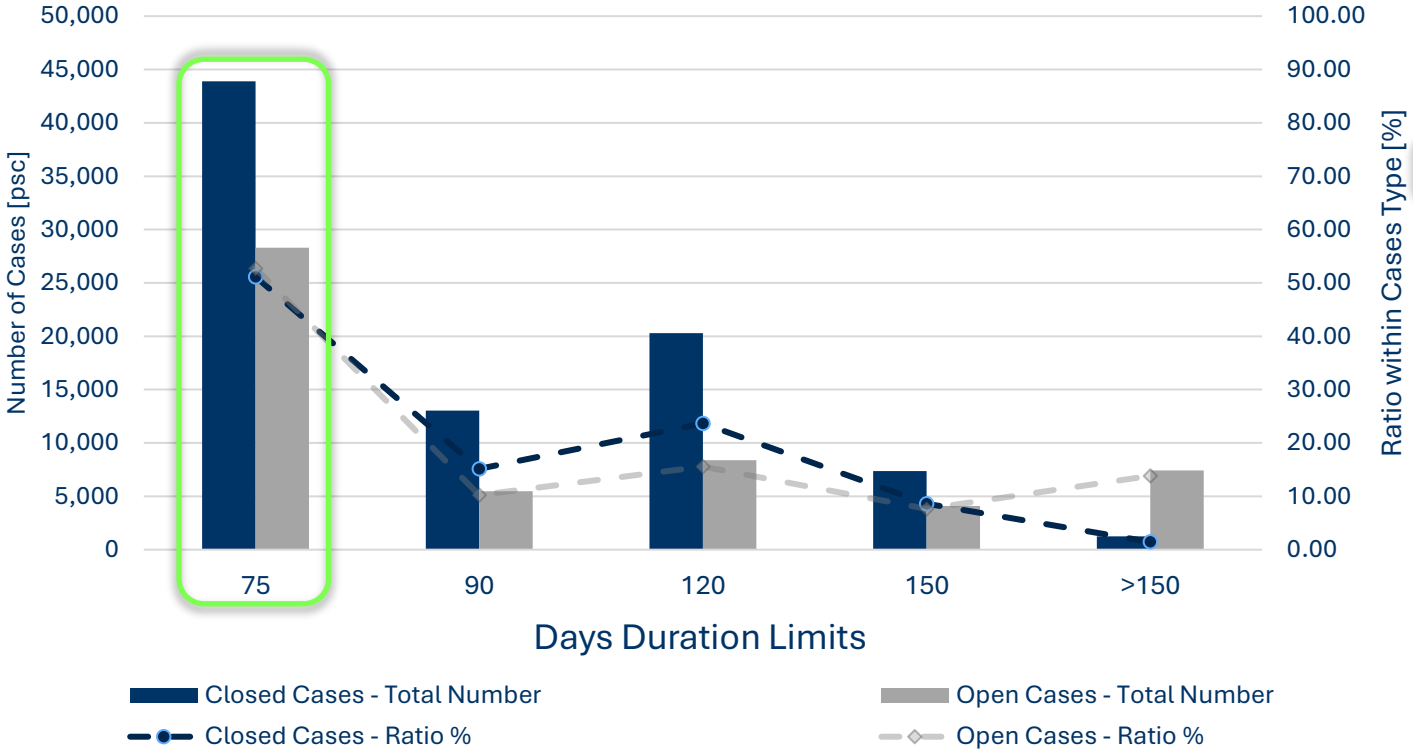
Recommended Actions

- Prioritise reduction of backlog in ageing open cases (>90 days).
- Review invoice clearing workflow and approval cycle in the IR → CI stage.
- Launch targeted deep-dive for Company 4, top vendors, and Packaging-related spend areas.

#Question 1: Is SLA performance deteriorating? (lead time vs backlog risk)

Status Overview

SLA Performance vs Backlog Evaluation



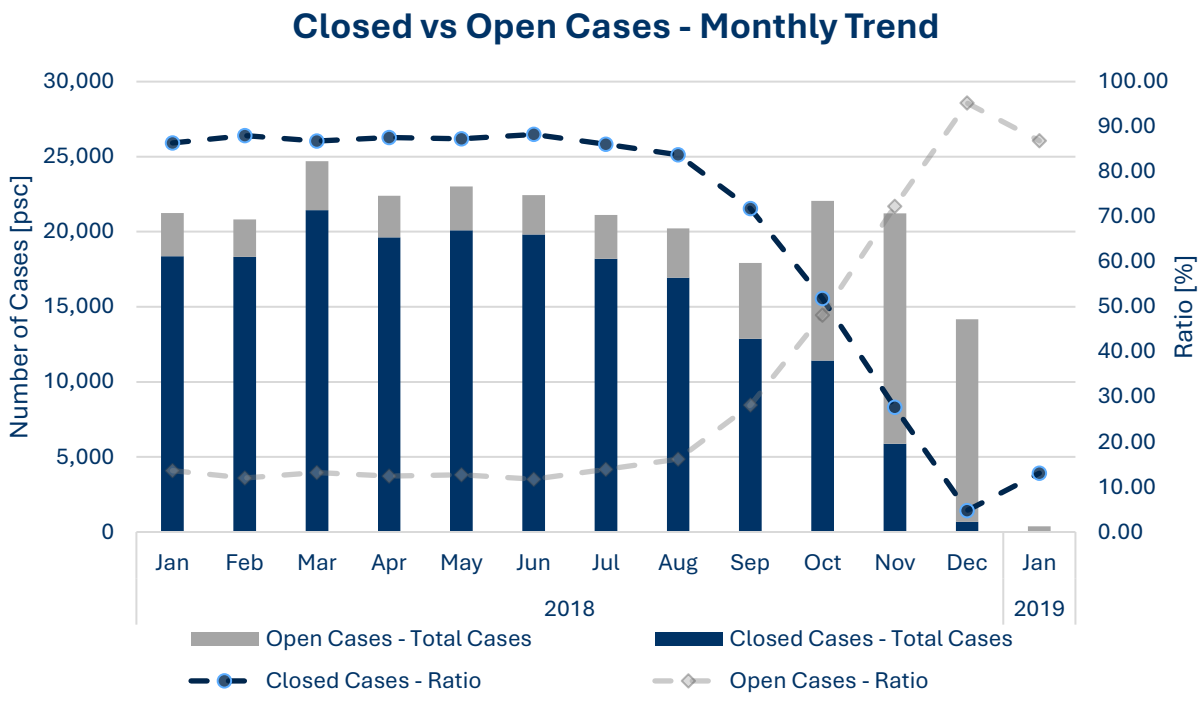
Snapshot status for Jan-2019 + 2H 2018

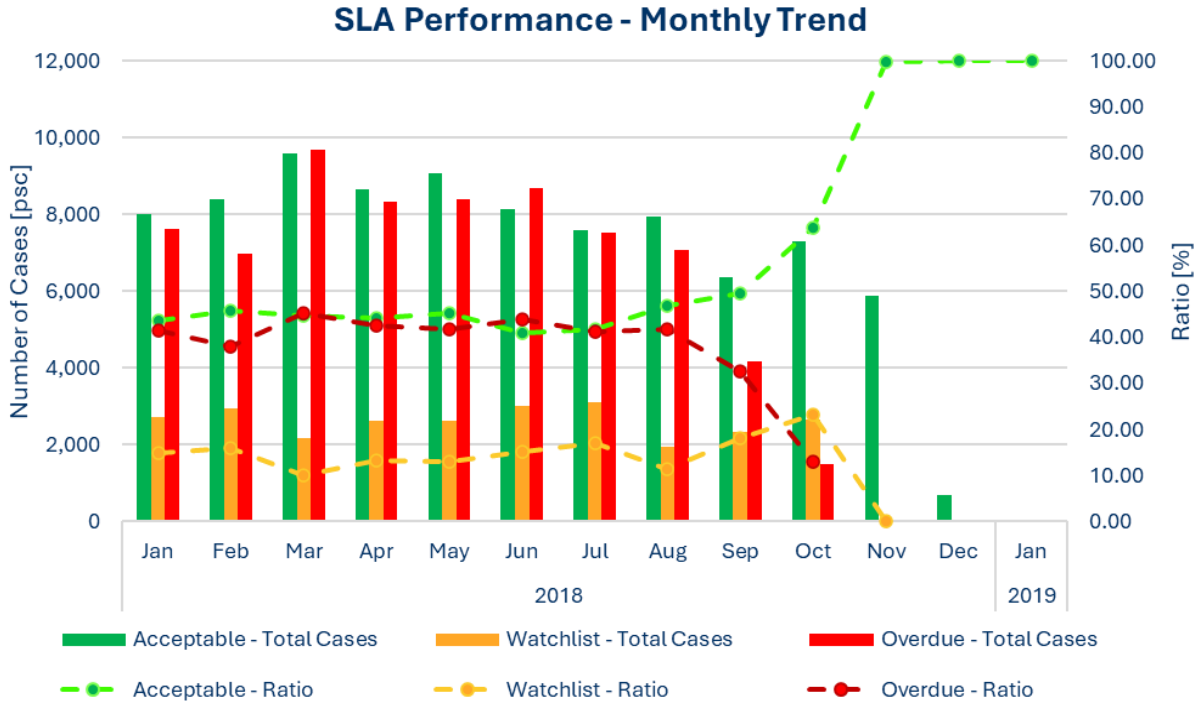
Days Duration Limits	Open Cases		Closed Cases	
	Total Number	Ratio [%]	Total Number	Ratio [%]
75	28,309	52.71	43,900	51.14
90	5,486	10.22	13,021	15.17
120	8,374	15.59	20,304	23.65
150	4,111	7.65	7,377	8.59
>150	7,424	13.82	1,243	1.45
Total	53,704	100.00	85,845	100.00

- In last 6 months over 50% cases was closed within the SLA window.
- Most open cases are still within the SLA window but require active monitoring to avoid breaching the limit.

#Question 1: Is SLA performance deteriorating? (lead time vs backlog risk)

Monthly Trend

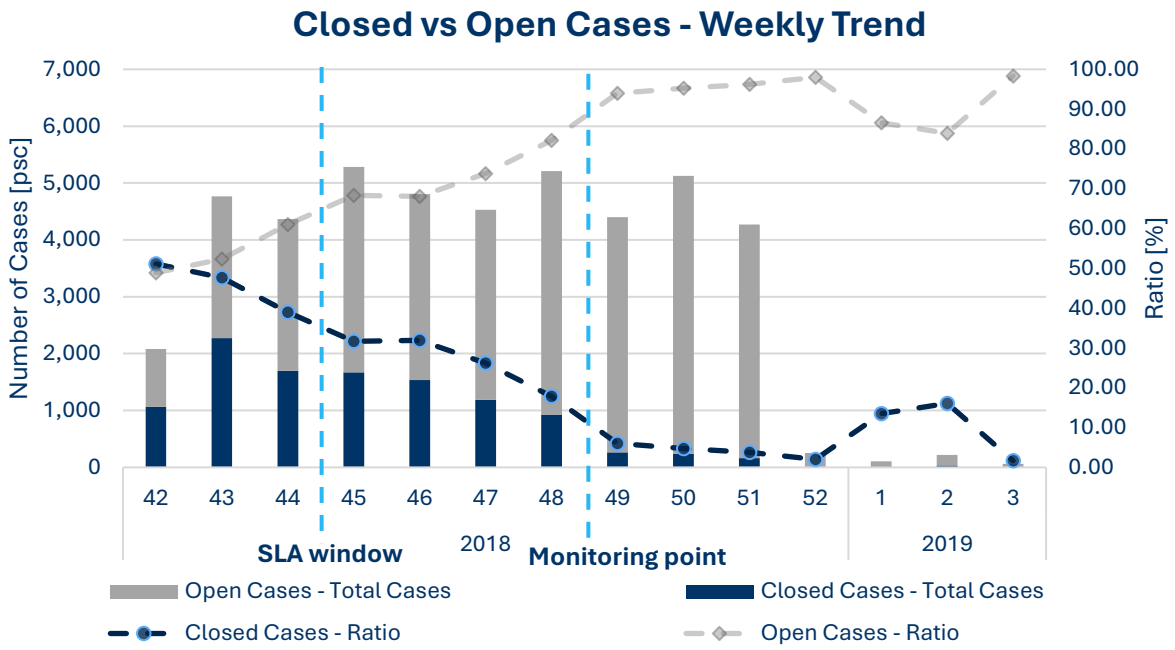




- The increasing share of open cases indicates a growing execution gap, despite stable SLA performance on closed cases.
- Historically, over 80% of cases are eventually closed, with 40–45% of them meeting the SLA target.
- In the latest period, a high share of closures in SLA is observed, however, the result may be partially distorted by the immaturity of the data (recent periods).

#Question 1: Is SLA performance deteriorating? (lead time vs backlog risk)

Weekly Trend



Closed cases duaration

	Duaration Days	
Stage	Median	P90
Closed Cases <= 75 days	51	70
Closed Cases > 75 days	105	164

Backlog overview

Snapshot status for: Jan-2019 + 2H 2018

Backlog	Total Number	Ratio [%]
All (>90 days)	19909	37.07

Backlog Breakdown	Total Number	Ratio [%]
120 days	8374	15.59
150 days	4111	7.65
>150 days	7424	13.82

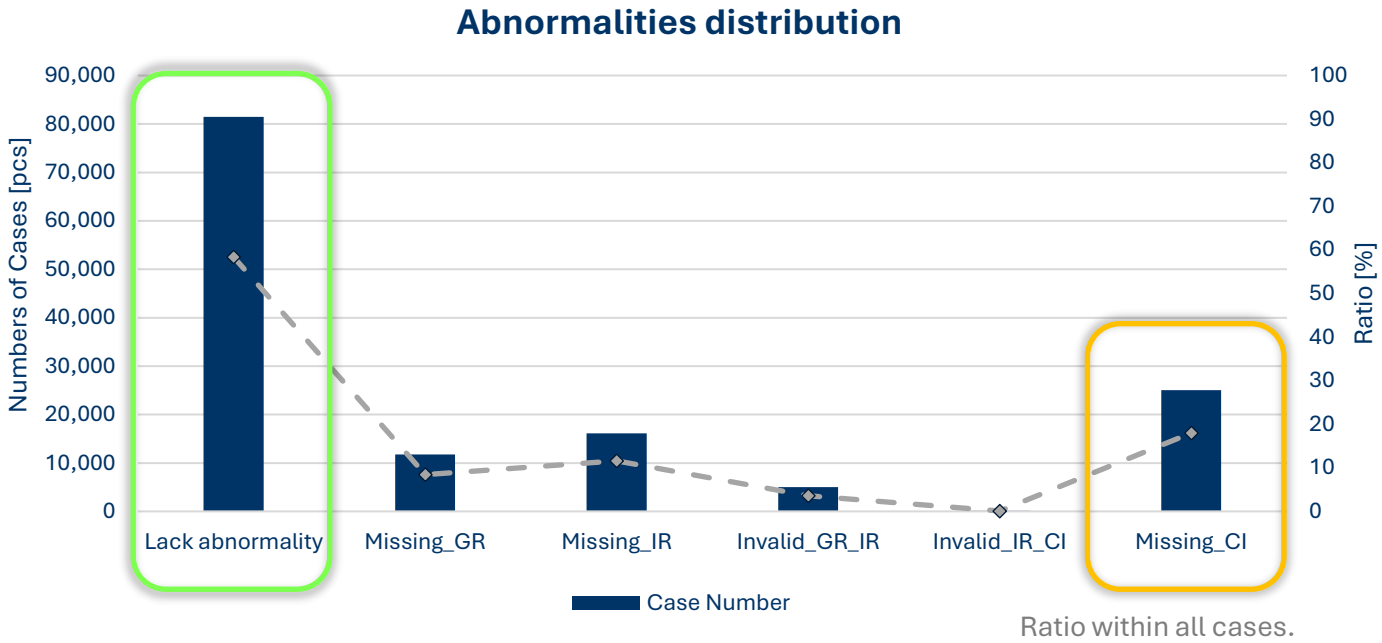
Ratio as % of cases within all open cases

- Median of days duration for closed cases with SLA is 51 days (~7 weeks).
- Indicates that cases beyond ~7 weeks begin to deviate from the typical course, therefore open cases in the 8–11 week range should be treated as a priority for monitoring and potential intervention.
- Backlog (cases >90 days) constitutes 37% of open cases, which indicates a significant accumulation of backlogs, especially in segments >150 days.
- **The issue is not SLA capability, but insufficient throughput leading to backlog accumulation.**

#Question 2: Where are the bottlenecks in the process?

Snapshot status for: Jan-2019 + 2H 2018

Abnormalities & Missingness distribution



Primary_Issue	Case Number	Ratio [%]
Lack abnormality	81,438	58.36
Missing_GR	11,766	8.43
Missing_IR	16,130	11.56
Invalid_GR_IR	5,034	3.61
Invalid_IR_CI	123	0.09
Missing_CI	25,058	17.96

- Abnormalities was present basic on Primary Issue.
- Primary Issue = earliest blocking issue
- Missing = first unavailable milestone
- Invalid = negative stage duration

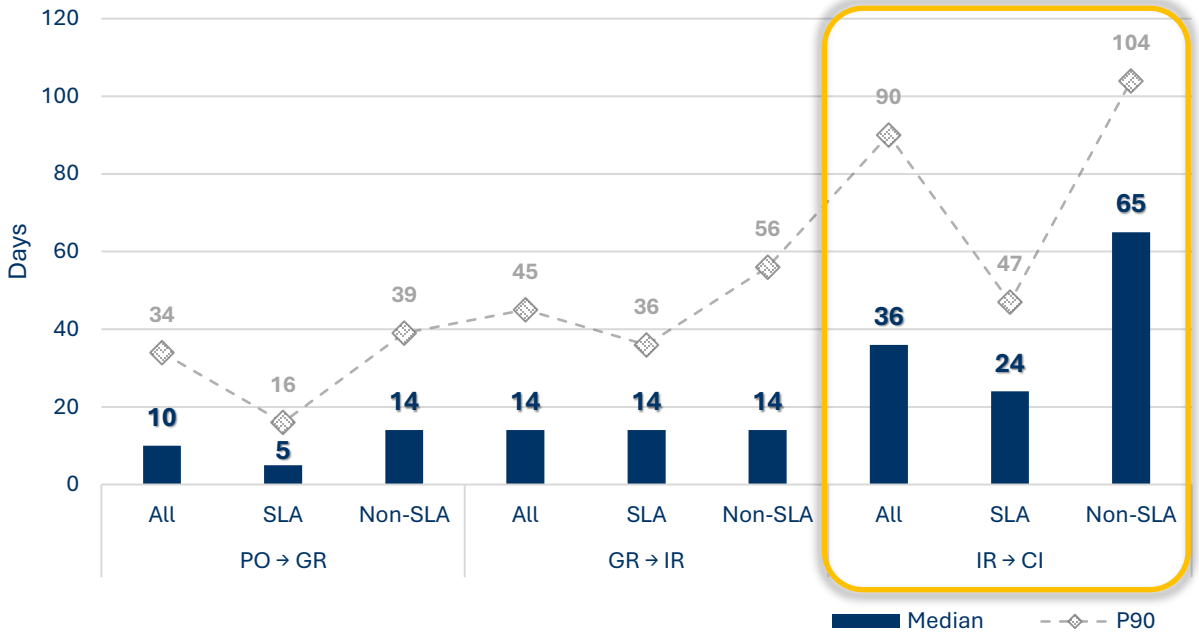
- Within presented cases almost 60% have all steps and correct data.
- There is below 4% cases which have invalid data, these cases was excluded from next analysis.
- The final stage (IR → CI) shows the highest missingness and should be prioritised for root-cause validation.

#Question 2: Where are the bottlenecks in the process?

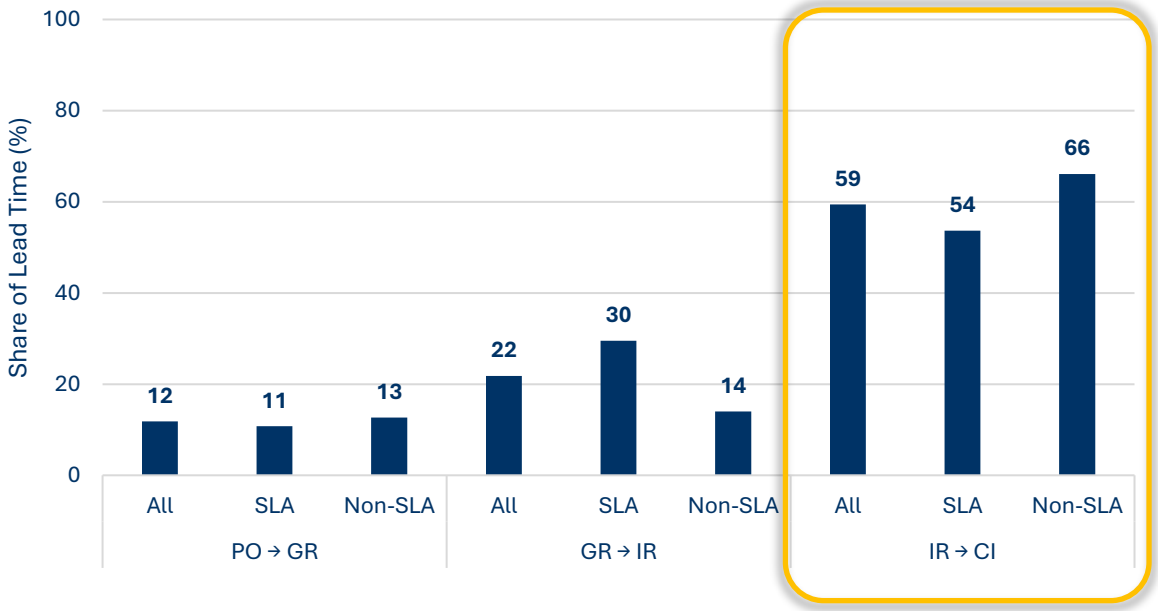
Stage duaration

Snapshot status for: Jan-2019 + 2H 2018

Stage Duration by Process Step (Closed Cases)



Median Lead Time Contribution by Stage



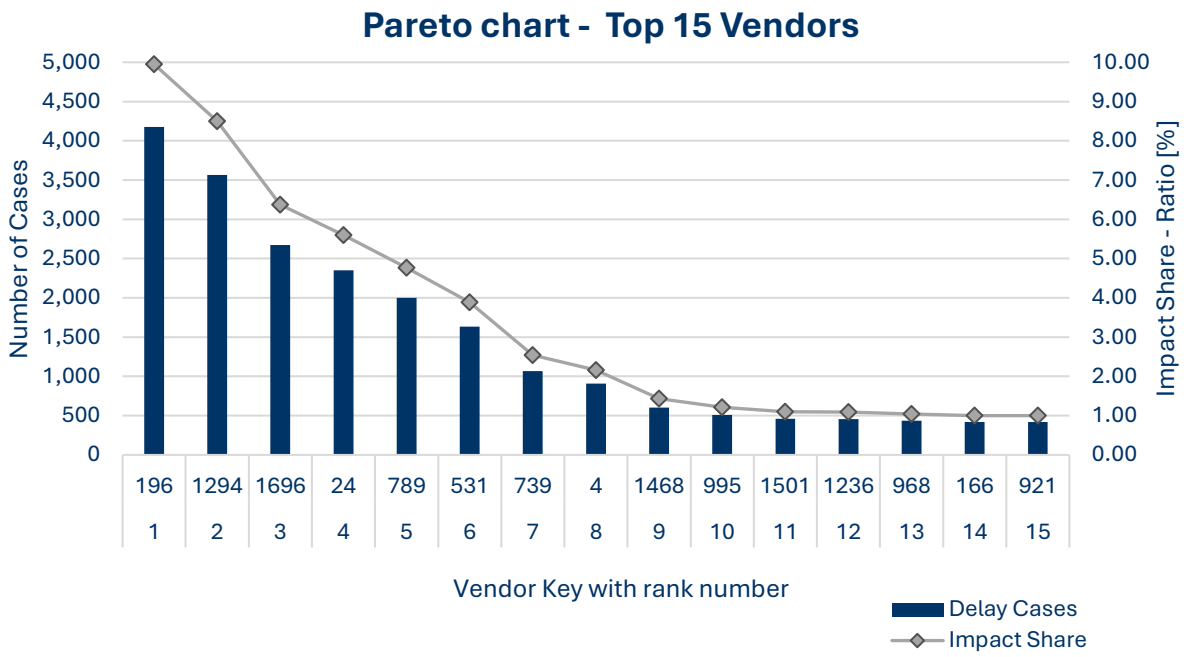
Contribution calculated as stage duration / total case lead time.

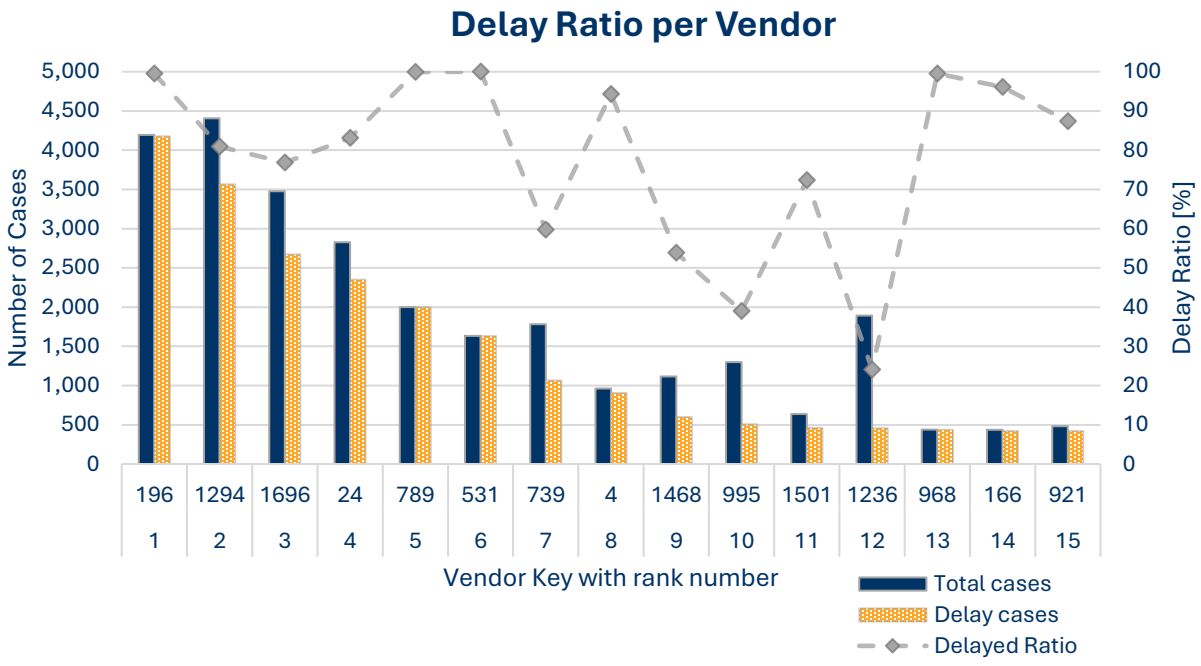
- The IR → CI stage has the highest median and P90 duration.
- IR → CI contributes more than half of total lead time in delayed cases.
- **The primary bottleneck is the IR → CI stage.**

#Question 3: Which segments (vendors, companies, spend areas) drive delays?

Vendors analysis

Snapshot status for: Jan-2019 + 2H 2018





Delay ratio as delayed cases / total cases.

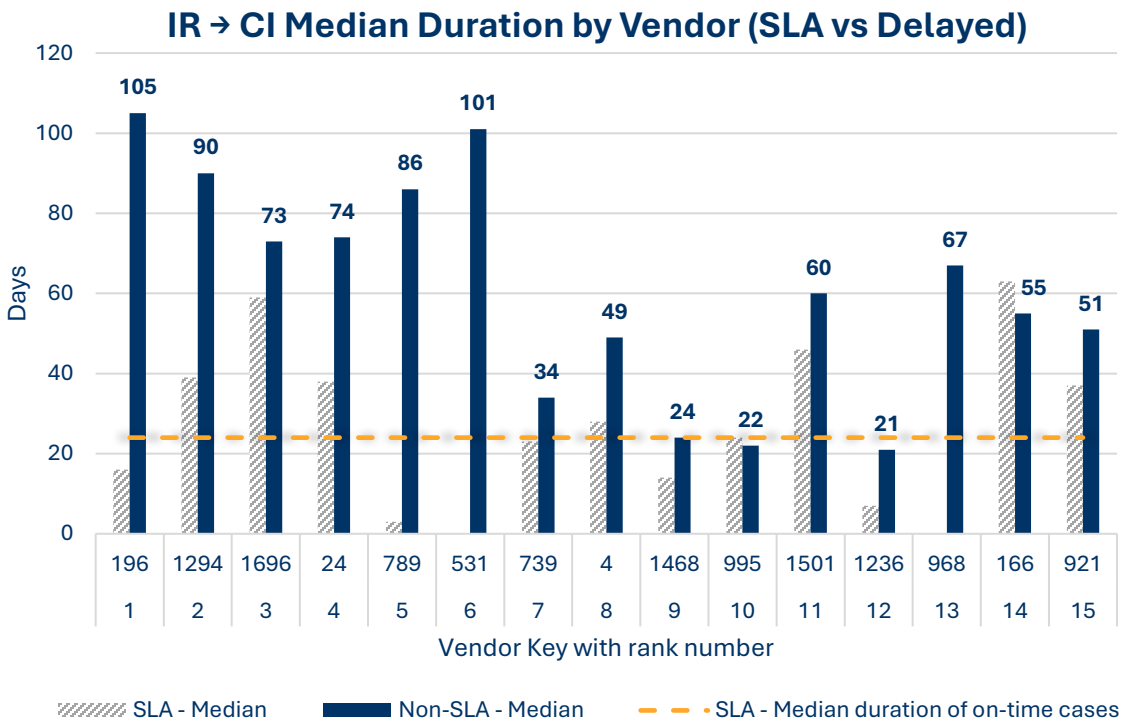
- **Delay risk is concentrated: top 15 vendors drive 52% of delayed cases.**
- The largest single vendor accounts for 10% of all delayed cases.
- Median delay rate across analysed vendors is 92%.
- 134 vendors met the analysis threshold.

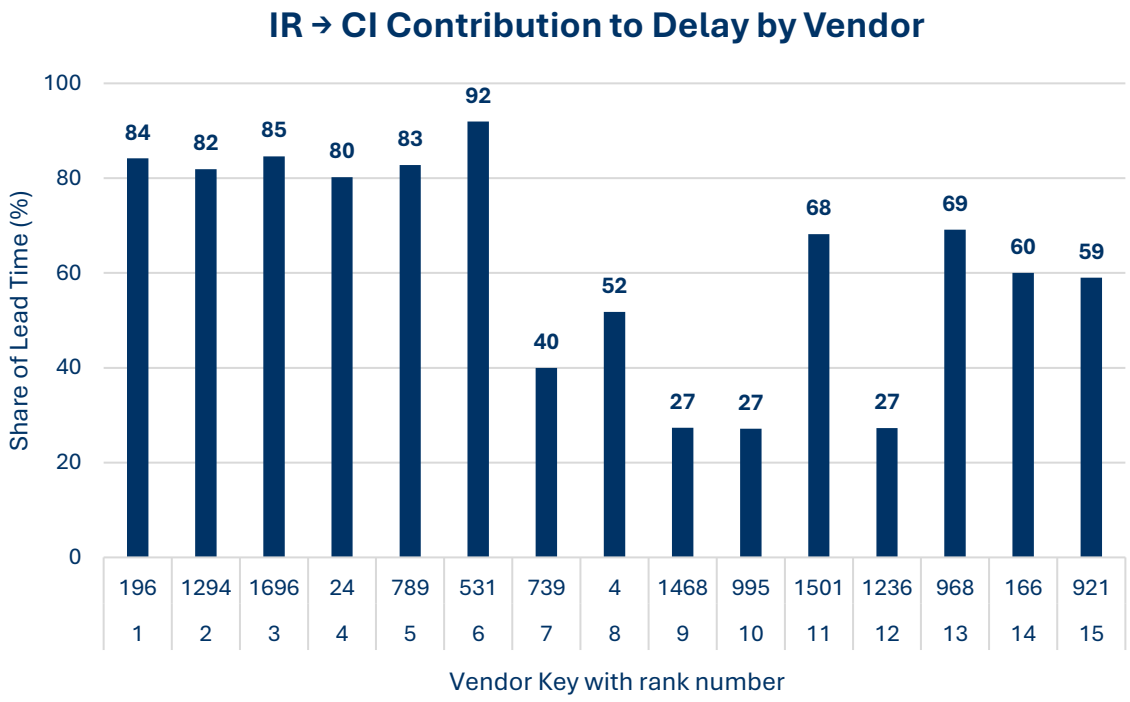
Vendor IDs used due to unavailable supplier names in source data.

#Question 3: Which segments (vendors, companies, spend areas) drive delays?

Spend area analysis

Snapshot status for: Jan-2019 + 2H 2018





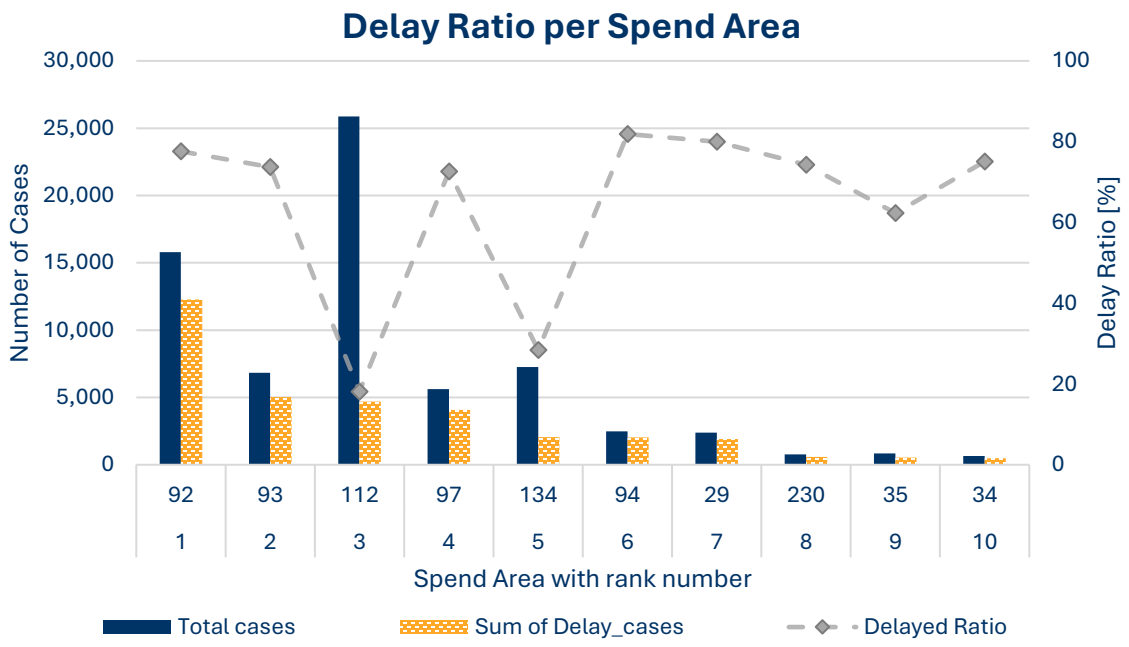
- Vendors with delayed cases perform materially worse than SLA benchmark.
- IR → CI remains the main bottleneck across vendors.
- **Delays are not only supplier-driven; internal downstream processing is also a key constraint.**

#Question 3: Which segments (vendors, companies, spend areas) drive delays?

Snapshot status for: Jan-2019 + 2H 2018

Spend areas analysis

Spend Area with sub category	Impact Share
Packaging	**57.19**
92: Labels	29.25
93: Metal Containers & Lids < 30L	12
97: Plastic Containers & Lids < 30L	9.72
94: Packaging - Other	4.84
230: Labels	1.38
Sales	**11.17**
112: Products for Resale	11.17
Trading & End Products	**4.91**
134: Trading products (old structure)	4.91
Additives	**7.01**
29: Extenders	4.57
35: Surfactants	1.26
34: Rheology & Thixotropic Agents	1.18



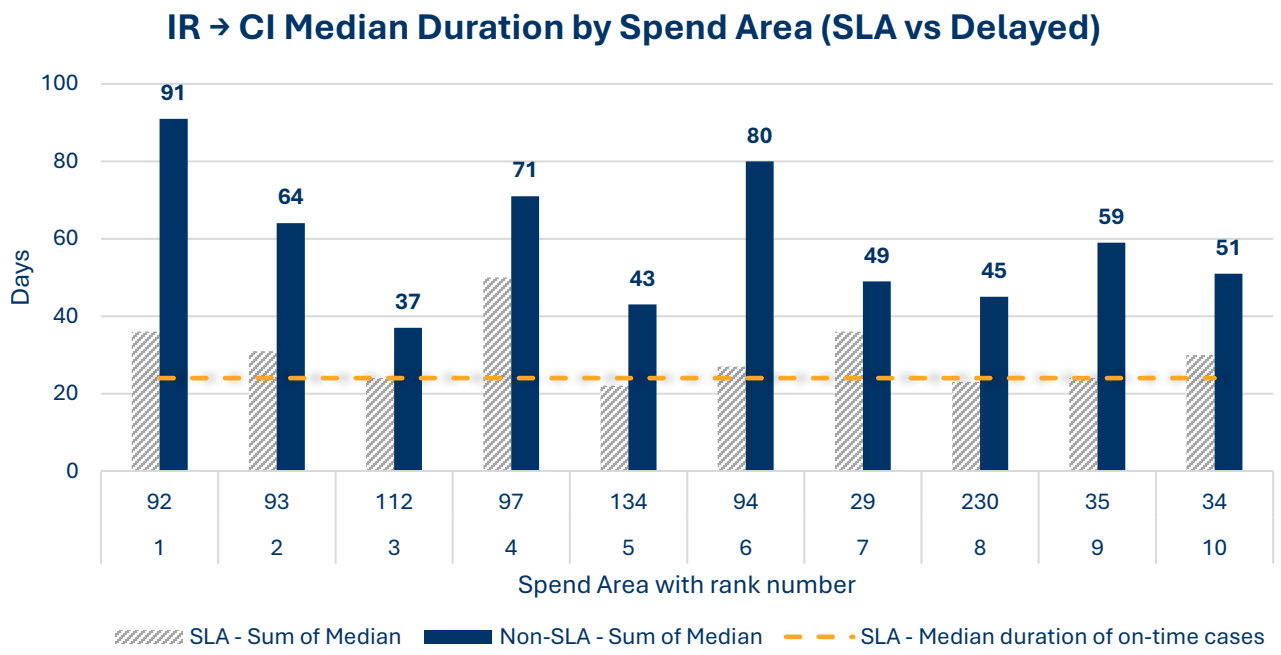
Delay ratio as delayed cases / total cases.

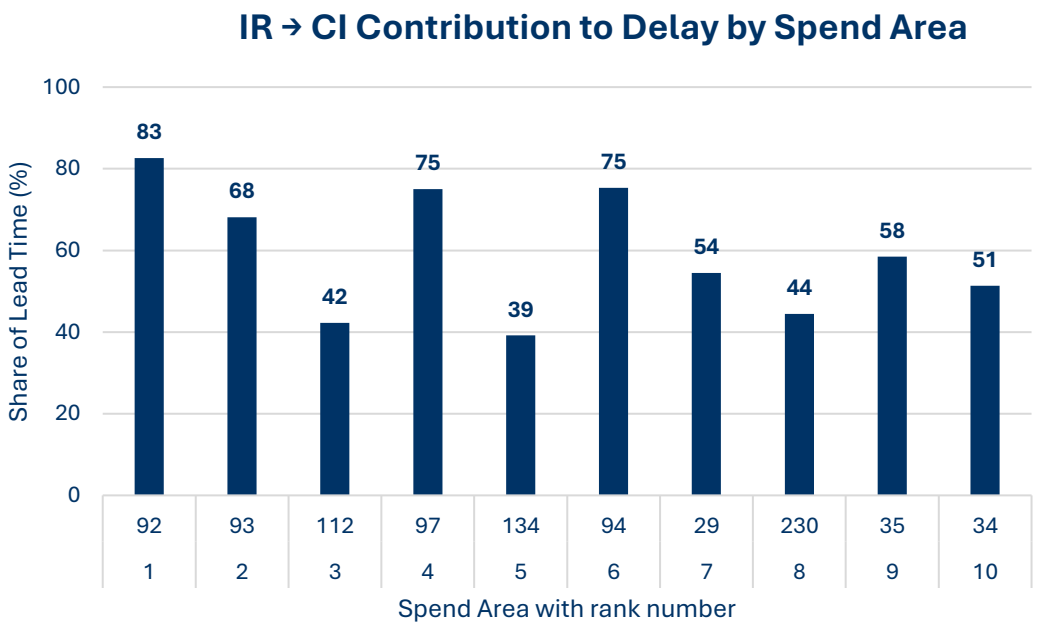
- **Delay risk is concentrated: top 10 spends areas drive 82% of delayed cases.**
- The largest single spend area ("Labels") accounts for 29% of all delayed cases.
- Within the top 10 spend areas, the Packaging sub-category drives the highest impact (57% of delayed cases).
- 54 spend areas met the analysis threshold

#Question 3: Which segments (vendors, companies, spend areas) drive delays?

Spend areas analysis

Snapshot status for: Jan-2019 + 2H 2018



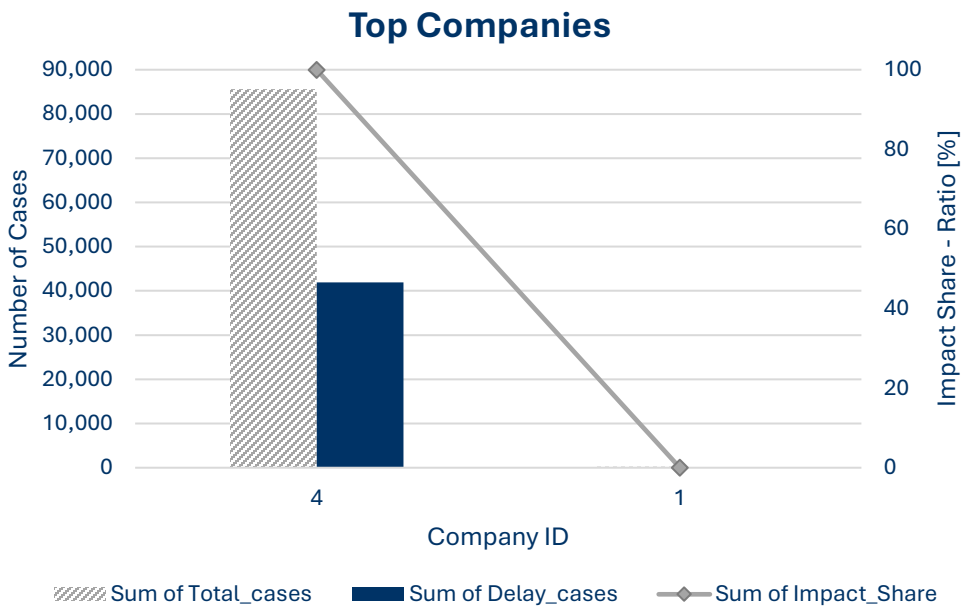


- Spend areas with delays have worst results than benchmark SLA.
- The IR → CI step is still main bottleneck, Median delay rate across analysed spend areas is 56%.
- **The problem in spend area is still for IR → CI.**

#Question 3: Which segments (vendors, companies, spend areas) drive delays?

Companies analysis

Snapshot status for: Jan-2019 + 2H 2018



Company ID	Total Cases	Delay Cases	Impact Share
4	85,610	41,941	99.99
1	235	4	0.01

- Company 4 accounts for 99.99% of delayed cases.
- Delay exposure is highly concentrated in one operating entity.
- **Priority review should focus on Company 4 workflow, ownership model, and controls.**

Company IDs used due to unavailable supplier names in source data.
